

iPuff Flowr1.0 User Manual

To start off, here is a quick reference guide identifying each of the parts:

Mouthpiece

Battery flowr1.0

To Power On/Off:

To turn on/off your iPuff flowr1.0, press the large power button 5x rapidly.

You will know the pen is turned on when the power button illuminates and vice versa.

Temperature Settings:

The temperature setting is indicated by the small light below the power button. To select and change the temperature settings, press and hold down the power button and watch the small light change colors. The temperature settings are as follows:

- Red - 360°F
- Green - 380°F
- Blue - 420°F

Once the temperature setting has been selected, wait for the chamber to reach its designated temperature as indicated by the large power button turning green from red. Your pen set is now ready to use, no need to hold power button down.

Vaping with the Flowr1.0:

Once the pen has been turned on, the temperature setting selected and the chamber has reached its designated temperature (large button has turned green), the pen is ready to start using. We highly recommend utilizing a rubber mouthpiece protector when puffing. Begin taking puffs and ensure that you are **NOT** pressing any buttons while taking on the pen.

Care Instructions:

Cleaning

The chamber can be cleaned using the cleaning brush that is provided with your set.

Screen Replacement

The metal screen inside the mouthpiece can be replaced by unscrewing the filter chamber inside mouthpiece and using one of the spare screens provided with your set.
